

1

Our in-country partners meet with the communities they serve to determine where the greatest need for water is.

2

They identify which type of project will work best for each community and prepare a proposal for funding.

3

Before funding, every proposal is thoroughly reviewed to ensure acceptable costs and construction timelines.

4

We begin sharing information from the projects with our supporters so they can see why these communities need their help.

5

We work with churches, individuals, schools, businesses and others to raise funds to build the approved projects.

6

We send the funds for each project to the field so our partners can begin constructing the wells.

7

Construction begins. Because the rainy season starts in late May, all construction work must happen between October and May.

8

It can take 6 to 18 months to fully complete a well. Working in these countries can be challenging, as infrastructure is limited.

9

Our partners send us regularly scheduled progress reports to keep us up to date with what's happening on the ground.

10

Water committees are trained to operate and maintain each well. Every community receives comprehensive water, hygiene, and sanitation training.

11

Partners complete construction and training at every site. Training is the most important factor in the sustainability of each water point.

12

Water to Thrive receives completion reports that include photos, GPS coordinates, and beneficiary information.

13

We carefully review every completion report to ensure each project was completed on budget in accordance with the original proposal.

14

Once verified, we share the completion reports with the donors, supporters, or sponsors who made it all possible.
